Metaclip Rolled Edge Shelving

Product Information

Metaclip rolled edge shelving has remained one of the most popular systems for the storage of medical records, archival documents and museum artifacts. The 'rolled' front edge to the upright frames not only ensures safety in operation but also presents a neat appearance which adds to the functional environment that we expect from today's record management departments. Lateral files can be suspended from adjustable cradles and folders can be separated with full height dividers.

Mounted onto mobile bases, Metaclip has been the preferred system for storing x-ray files in hospitals throughout the U.K. Access to individual shelving bays can be restricted, but by incorporating additional gangways, a trade off between capacity and accessibility can be achieved. In some hospital X-ray departments the need to have constant access to more than one picking face dictates that the layout should incorporate more than one picking aisle which in itself is wider than normal. This means that two or more operatives can be active in the same gangway.

Doctor's surgeries, health centres, hospitals as well as offices and museum archives can all benefit from the flexible and cost-effect solutions provided by choosing Metaclip shelving.

As an ISO 9001 accredited company and a founder member of the Storage Equipment Manufacturers Association (S.E.M.A.) **metalraxstorage** promote and adhere to the design standards set out in the Association's Interim Codes of Practice.
